

## **BLAZEBLOCKER ICE™**

**is not intended as a patch system.  
It is designed to seal panels in Firewall assembly.**

Proper wrapped corner

The double wrapped corner

This is an example of poor product use;  
notice the exposed open side.

Through proper application, the tape is a proven fire retardant by sealing the joint. The maximum span between gypsum panels is  $3/16$ " for acceptable use without compound.

Pre-fill void areas or gaps larger than  $1/4$  " as normal prior to taping. HVAC, water, gas and electric gypsum penetration spans must be sealed air tight; taping these areas with **BLAZEBLOCKER ICE™** is acceptable when used in conjunction with fire caulk application prior to sealing.
